TITLE: Automatic Recording of Cosmic Ray Outburst (Avtomaticheskaya registratsiya vspyshek kosmicheskogo izlucheniya)

PERIODICAL: Pribory i Tekhnika Eksperimenta, 1957, No.5, pp. 58 - 59 (USSR).

ABSTRACT: Studies of major solar outbursts in the intensity of cosmic radiation (Ref.1) are of major interest in the solution of the problem of the mechanism of production of cosmic rays on the sun. To solve the theoretical problem it is necessary not only to detect the presence of an increase in the intensity but also to know the moment at which the intensity begins to increase (to within a minute), the rate of growth up to the maximum, and the rate of fall to the normal level thereafter. In accordance with the recommendation of the International Committee for the IGY (15.9.56) it is necessary to record increases in the intensity of cosmic rays of the order of 10% and their beginning to  $\pm 0.5$  min. A method for an automatic recording of the beginning of an increase in the intensity of the hard component of cosmic radiation is now described. Increases greater than or equal to 5% can be measured with an accuracy of less than 0.5 min. The device includes a fast recorder of the number of coincidences seen by a cubic telescope

accuracy of  $\pm 2.2\%$ . In order to increase the stability of the working threshold, the recorded radiation is compared with the frequency of the standard oscillator which is stable to 0.1 - 0.01%. The comparison is carried out by means of a discrete count of the radiation pulses and the pulses from the oscillator using the counter circuit shown in Fig.1. There are 1 figure and 3 Slavic references.

TITLE: An Apparatus for the Automatic Measurement of Multiple Scattering of Particles (Ustanovka dlya avtomatizatsii izmereniy mnogokratnogo rasseyaniya chastits)

PERIODICAL: Pribery i tekhnika eksperimenta, 1959, Nr 2, pp 86-90 (USSR)

ABSTRACT: The instrument may be used to carry out both measuring and computing operations on multiple Coulomb scattering. It can also be used to measure lengths. The table of the microscope can be moved repeatedly through fixed intervals (50, 100, 250 and 500  $\mu$ ). The second coordinate which gives the deviation of the track from the x-axis is transformed into electrical pulses by means of a photoelectric device in the micrometer eyepiece. These pulses are transmitted to the computing part of the apparatus and the number of pulses given by the photoelectric device in each measurement of the y-coordinate is proportional to the magnitude of the first difference in the coordinates. The instrument is not fully automatic since an observer must place the track manually in a standard position. The apparatus was checked

of Particles

against an observer and the average percentage difference between the semi-automatic machine and an observer working with an ordinary microscope is 1-5%. The use of this machine cuts down the scanning time by a factor of 5 and increases the accuracy because it eliminates any possible arithmetical errors committed by the observer. The instrument can also be used with bubble chambers and Wilson cloud chambers. A.V. Shileiko and M.I. Tret'yakova are thanked for their help.

Radioactive Isotopes (Cont.)

80V/5486

**PURPOSE:** The book is intended for technical personnel concerned with problems of application of radioactive isotopes and nuclear radiation in all branches of the Soviet economy.

**COVERAGE:** An All-Union Conference on problems in the introduction of radioactive isotopes and nuclear radiation into the national economy of the Soviet Union took place in Riga on 12-16 April 1960. The Conference was sponsored by: the Gosudarstvennyy nauchno-tekhnicheskiy komitet Soveta Ministrov SSSR (State Scientific and Technical Committee of the Council of Ministers, USSR); Glavnoye upravleniye po ispol'zovaniyu atomnoy energii pri Sovete Ministrov SSSR (Main Administration for the Utilization of Atomic Energy of the Council of Ministers, USSR); Academy of Sciences, USSR; Gosplan USSR; Gosudarstvennyy komitet Soveta Ministrov SSSR po avtomatizatsii i mashinostroyeniyu (State Committee of the Council of Ministers, USSR, for Automation and Machine Building) and the Council of Ministers of the Latvian SSR. The transactions of this Conference are published in four volumes. Volume I contains articles on the following subjects: the general problems of the Conference topics; the state and prospects of development of radiation chemistry; and results and prospects of applying radioactive isotopes and nuclear radiation in the petroleum refining and chemical industries. Problems of designing and manufacturing instruments which contain sources of radioactive radiation and are used for checking and automation of technological processes are examined, along with problems of accident prevention in their use. No personalities are mentioned. References accompany some of the articles.

TITLE: A pulse counter which uses cold cathode tubes. Class 42, No. 170761

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 9, 1965, 94

TOPIC TAGS: pulse counter, cold cathode tube, coincidence counter

ABSTRACT: This Author's Certificate introduces: 1. A pulse counter based on cold cathode tubes which are series controlled by coincidence circuits. The device is designed for reducing the number of tubes required for a scaling factor of 6. The counter input is connected directly to the first stage. The input is connected to the second stage through a coincidence circuit which controls the first stage, and to the third and fourth stages through coincidence circuits which control the second stage. The outputs of the third and fourth stages are connected to the neutral inputs of the first and second stages, either through a load resistance or through a diode. 2. A modification of this pulse counter which is designed for a scaling factor of 10. This unit contains an additional stage which is connected

TITLE: Ring counter of cold cathode tubes. Class 21, No. 174665

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 18, 1965, 37

TOPIC TAGS: counter circuit, cathode tube

ABSTRACT: This Author Certificate presents a ring counter of cold cathode tubes with a digital indicator lamp whose cathodes are connected to the anodes of the counter tubes. To simplify the digital lamp quenching circuits, to shape the input signals, and to insure count reversibility, the counter tube anodes are connected through their quenching capacitors to the indicator lamp anode and to coincidence circuits. The second inputs of the coincidence circuits are connected to the direct and reverse count buses. The outputs are connected to the tube grids of the preceding and succeeding stages.

TITLE: A device for converting the voltage of a continuous signal. Class 21, No. 150924

SOURCE: Izobret prom obraz tov zn, no. 18, 1966, 180

TOPIC TAGS: electronic signal, signal shape, signal conversion, cold cathode, diode electron tube

ABSTRACT: This Author's Certificate introduces: 1. A device for converting the voltage of a continuous signal into stepped voltage. The unit consists of a reservoir capacitor and a diode connected in series. An identical change in voltage amplitude from one step to the next is provided by using the voltage difference between the ignition and quenching voltages in a cold-cathode diode. 2. A modification of this converter in which a resistor is connected in series with the reservoir capacitor. This resistor is shunted by a condenser with a capacitance which is low in comparison with that of the reservoir capacitor. 3. A modification of this converter designed for voltages of either polarity. Two cold-cathode diodes are connected in series and the signal to be converted is fed through a common reservoir capacitor between these diodes. Voltages of one polarity are taken from the anode of one diode and those of the opposite polarity are taken from the cathode of the second diode.

TITLE:

Magnetic surfaces

PERIODICAL: Zhurnal tekhnicheskoy fiziki, v. 31, no. 10, 1961, 1153-1163

TEXT: In connection with magnetic plasma traps, a formula for magnetic equipotential surfaces in curvilinear coordinates adapted to the lines of force is derived on the following assumptions: 1) The entire field  $\vec{H}$  consists of a quasi-homogeneous, longitudinal part  $\vec{H}^3$  and a relatively small perturbation  $\vec{h}$ . 2)  $\vec{h}$  is a periodic function of  $x_3$ , and its average over  $x_3$  is zero; the coordinates  $x_3$  coincide with the lines of force of the field  $\vec{H}^3$ . The formula reads  $\bar{A}_3 - \frac{\sqrt{g}}{H_0^3} \hat{H}^1 H^2 = \text{const}$ , where  $A_3$  is the longitudinal, covariant component of the vector potential,  $H_0^3$  is the constant part of the longitudinal field, and  $H^1$  are the components of the "transverse" field, which are small compared with  $H_0^3$ .  $g$  is the functional

Card 1/3

Magnetic surfaces

28768

S/057/61/031/010/001/015  
B111/B112

If the field is helically symmetric, the magnetic surfaces can be exactly determined in this case. All magnetic surfaces discussed here (rosette, chains and intertwined tubes) are significant for plasma trapping. If the position of a magnetic surface and the distribution of the lines of force on it are known, it will be possible to construct the adjacent surfaces. At a normal distance  $w$  from the given surface, fields with translational symmetry ( $\vec{H} = \vec{H}(x, y)$ ), axial symmetry ( $\vec{H} = \vec{H}(r, z)$ ), and helical symmetry ( $\vec{H} = \vec{H}(r, \theta)$ ) are given by  $wH_{\perp} = \text{const}$ ,  $wrH_{\perp} = \text{const}$ , and  $w\sqrt{1 + \alpha^2 r^2} \cdot H_{\perp} = \text{const}$ , respectively, where  $H_{\perp}$  is the magnetic-field component on the given surface, which is perpendicular to  $z$ , to the  $\varphi$ -lines, and to the helical lines  $\theta - \varphi - \alpha z = \text{const}$ , respectively. I. M. Gel'fand, M. I. Grayev, and M. A. Leontovich are thanked for discussions. There are 10 figures and 6 references: 4 Soviet and 2 non-Soviet. TITLE: Quasilinear theory of current instability in a plasma

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 50, no. 1, 1966, 220-231

TOPIC TAGS: plasma instability, electron temperature, ion temperature, Coulomb collision, plasma interaction, plasma oscillation, plasma heating, plasma flow, electric field, current stabilization

ABSTRACT: The authors present an analytic solution of the problem of instability of a current flowing in a plasma situated in a specified electric field, in the quasilinear approximation. The electron temperature is assumed to be much higher than the ion temperature. Coulomb collisions are neglected completely. The initial equations are the same as used by E. C. Field and B. D. Fried (Phys. Fluids v. 7, 1937, 1964), except that in the present article the authors take into account several additional important features of the phenomenon. The specified electric field is assumed to be sufficiently large so that the Coulomb collisions do not interfere with the free acceleration of most of the electrons. The re-

Card 1/2

current instability is described in detail. It is shown that during a certain period of time the current remains constant and subsequently, as a result of the electron heating, runaway electrons appear and thus cause an increase of the current with further increase in time. The rate of ion heating during the process is also calculated. The results are applied to the instability of the current in a bounded plasma and in a strong magnetic field. Orig. art. has: 24 formulas.

Title : Antabuse - Inhibitor of Hemopoiesis

Orig Pub : Zh. nevropatol. i psikhatrii, 1957, 57, No 10, 1248-1252

Abstract : A repeated intraperitoneal administration of antabuse (A) to rabbits in doses of 200 mg/kg., and higher, is accompanied by the development of leukopenia together with anemia. Alongside with its action upon the formed elements of the peripheral blood, A produces considerable depletion of the bone marrow of myelokaryocytes. On the 18th-30th day following the first administration of A, the rabbits perish in convulsions which usually develop against a background of apparent well-being. It is to be noted that the described action of A manifests itself only when administered doses considerably exceed those used under clinical conditions.

PERIODICAL: Referativnyy zhurnal, otdel'nyy vypusk, 47. Khimicheskoye i kholodil'noye mashinostroyeniye, no. 1, 1963, 7, abstract 1.47.44 (Lakokraskochn. materialy i ikh primeneniye, no. 4, 1962, 56 - 59)

TEXT: The dispersion process of zinc-white paints in the binder is examined with different paint concentrations using magnetostrictive and piezoelectric converters as the generator of ultrasound. It has been established that, instead of rubbing zinc-white paints in ball and color mills, their pastes can be treated with ultrasound having a frequency of 18 kc and an intensity of 3 w/cm<sup>2</sup>. Enamels prepared with ultrasound and filtered show no qualitative difference as compared to enamels prepared under the usual operating conditions. There are 3 figures and 4 references.

This article analyzes accuracy of shape and accuracy of dimensions of machined parts. The author develops a method for adding up inaccuracies of shape and inaccuracies of dimensions and gives useful tables which make it possible to determine the spread of overall error for the given relation  $\delta_s / \delta_d$  (where  $\delta_s$  = inaccuracy in shape, and  $\delta_d$  = inaccuracy in dimensions)

**AUTHORS:** Korablev, P.A., Fefor, A.I. SOV/119-58-7-8/10

**TITLE:** On the Problem of Adjusting Rotary Automatic Machines  
(K voprosu o podnaladke tokarnykh avtomatov)

**PERIODICAL:** Priborostrayeniye, 1958, Nr 7, pp. 26-28 (USSR)

**ABSTRACT:** The basic system of an automatic adjusting apparatus operates as follows: The measuring device, which indicates the total dimensions of the working parts in-as-much as they deviate from those to which they are adjusted emits electric pulses in accordance with these deviations. The latter are transmitted to the organ operating the cutter tool, the height and the direction of the pulses determining the shifting of this tool.  
The following may be said as the result of experimental tests:

- 1.) The wear of the cutting tool exercises the greatest influence upon the accuracy of the working parts.
- 2.) This influence causes displacement above all in one direction, so that in automatic adjustment only a simple mechanism is necessary for the purpose of eliminating this fault.
- 3.) Faults of shapes can be measured together with faults of dimensions by means of rotary automatic machines.

Card 1/2

On the Problem of Adjusting Rotary Automatic Machines

SOV/119-58-7-8/10

4.) Faults with respect to shapes and dimensions are quite considerable with working conditions being as they are just now, so that automatic adjustment is rendered rather difficult. At present a device for the automatic re-adjustment of a rotary automatic apparatus is being developed by a plant which manufactures these apparatus. There are 5 figures, 2 tables, and 1 Soviet reference.

TITLE:

Investigation of accuracy of reaming and broaching  
operations

PERIODICAL:

Moscow. Aviatsionnyy tekhnologicheskii institut.  
Trudy. No. 47. Moscow, 1960. Nekotoryye voprosy  
tochnosti tekhnologii proborostroyeniya, pp. 60-66.

TEXT:

Reaming and broaching are methods of accurate  
machining of holes by means of a dimensional cutting tool, i.e.  
such a tool whose dimensions are transmitted to the component to  
be machined. The total error when a machining operation is carried  
out by a dimensional instrument can be found from the following  
formula:

$$\Delta = \Delta_{ve} + \sqrt{\Delta_{me}^2 + \Delta_{tool}^2}$$

(1)

where  $\Delta_{ve}$  - value of the variable systematic error caused by the  
wear of the cutting tool;  $\Delta_{me}$  - value of the instantaneous error

Card 1/ 5

22494

S/536/60/000/047/002/002

E113/E135

Investigation of accuracy of reaming and broaching operations of machining;  $\Delta_{\text{tool}}$  - value of the tool's manufacturing tolerance. It has been shown by experiment that the wear characteristic of reamers and broaches is approximately a straight line when plotted against the quantity of components machined. This allows the introduction of relative tool wear  $u_0$ , i.e. tool wear related to 1000 m. of cutting length. Hence,  $\Delta_{\text{ve}}$  is calculated from the formula:

$$\Delta_{\text{ve}} = 2u_0 \ell / 1000 \quad (2)$$

where  $\ell$  - length of cutting. The cutting length may be found in terms of the dimensions of the tool and the component. The instantaneous error  $\Delta_{\text{me}}$  depends on a number of technological factors and its values have been found by experimental methods for various cases. It has been established that the main factors affecting the instantaneous error are the number of passes in reaming and the number of passes as well as the conditions of clamping the component being broached, (i.e. whether the component is clamped with a machined or unmachined surface as the contact area),

Card 2/ 5

22494

S/536/60/000/047/002/002  
E113/E135

**Investigation of accuracy of reaming and broaching operations**

Apart from that, experiments have shown that the total machining error is greatly affected by irregularities in the cross section of the component such as ovality. The manufacturing tolerance of the tool has been taken as 0.005 mm. On the basis of the method developed, the accuracy in reaming and broaching has been calculated and plotted, Fig.6: accuracy characteristics in reaming and broaching operations (continuous lines show the standard fields of tolerances; dotted lines give the values of the total machining errors without taking into account the errors resulting from wear). Field of dispersion, microns, vs. diameters, mm.

1 - broaching and reaming in one operation; 2 - broaching in two operations; 3 - reaming in two operations.

To these values the calculated error caused by the wear of the cutting tool  $\Delta_{ve}$  should be added. It has been shown experimentally that in case of reaming, the diameter of the hole to be machined increases relative to the diameter of the reamer. The value of this increase for steel, cast iron and aluminium components has been found to be between 0.002-0.017 mm for hole

X

Investigation of accuracy of reaming and broaching operations  
diameters of 20-35 mm with average values of 0.005 mm. In the  
case of broaching holes under similar conditions, shrinkage of  
diameters by 0.002-0.021 mm has been observed, the average value  
being 0.009 mm. The shrinkage develops as a result of the elastic  
deformation of the components (tubes with wall thickness of  
3-5 mm).

There are 6 figures.

AUTHORS: Korablev, P.A., Candidate of Technical Sciences, Docent  
and Suminov, V.M., Engineer

TITLE: The effect of stiffness of the mechanical system on the  
wear of a cutting instrument

SOURCE: Moscow. Aviatсионnyy tekhnologicheskii institut. Trudy,  
no. 52, 1961. Nekotoryye voprosy sovremennoy tekhnologii  
priborostroyeniya, 45 - 51

TEXT: The authors consider the results of experimental determina-  
tion of wear of a cutting tool as dependent on the stiffness of  
bench instrument workpiece system, by the process of manufacturing  
workpieces from various materials on turret lathes and milling and  
on cylinder- and - cone grinding machines. The experiments were car-  
ried out with blanks of identical dimensions on benches, the stiff-  
ness of which was determined by technological methods. The quantity  
of blanks in one batch was 70 - 100, the operations were carried out  
using the same, if possible, cutting methods and same shape and sa-  
me cutting tool. Blanks were chosen so as to have much greater stiff  
Card 1/2

The effect of stiffness of the ...

S/536/61/000/052/004/008  
D201/D301

ness than that of the bench. The blank materials were as follows:  
Steel 2X13 (2Kh13), 3N474 (EI474), 49X (49Kh), 40, 50, bronze  
БРАМУ 9-2 (BrAMTs9-2), duralumin Д16А-Т (D16A-T). The results  
have proved that in order to reduce the wear of the cutting tool and  
to increase the degree of precision of work, cleanliness of workpie-  
ce surface and reproducibility, one of the most important condi-  
tions to be observed is the stiffness of the whole mechanical sys-  
tem. There are 6 figures, 1 table and 1 Soviet-bloc reference.

69 Koroblev, S.S. Investigation of Resonance Properties of Mechanical  
Systems

Results of theoretical and experimental investigations of the  
processes of transition through resonance in mechanical vibrating  
systems are presented. The results of an investigation of  
resonance properties of a centrifugal vibrator with non-linear  
restoring force are discussed.

69 Baskirskii, L.A. Dynamics of the Transition Through Resonance of  
Vibrations of Shafts With Different Moments of Principal Inertia,

With the Coupling to an Engine Rotor into Account  
Vibrations of shafts with different principal-inertia moments  
during transition through the zone of static instability are  
investigated. Equations of motion and methods for their solu-  
tion are presented.

101 Osipov, I.A. Investigating the Process of Producing Splines on  
Shafts by Broaching or Planing With Gang Tools

Basic theoretical considerations on the selection of methods  
for cutting splines in shafts are developed. Broaching and  
planing are experimentally investigated and recommended as  
the most efficient methods for cutting splined shafts in large-  
lot and mass production.

121 Konev, I.Ye. Investigation of Methods of Compacting Casting  
Molds

The effect of vibrations on the process of compacting molds by  
compression is investigated. Results indicate that vibrations  
make it possible to obtain uniformity of density at compression  
pressures several times lower than those used in compacting  
without vibration.

131 Beskin, M.B. Investigation of Contact Areas of Rough Surfaces

The relationship between the contact area (consisting  
of elastic and plastic contact areas) the surface roughness,  
and the material properties of the surfaces in contact is  
investigated. Results indicate that the size of the actual  
contact area is considerably affected by the geometry of the  
surface.

143 Erashchin, M.D. Investigation of the Accuracy of Determining  
Wear by the Method of Crescent-shaped Indentations

An experimental investigation was made of the accuracy of  
determining metal wear by the indentation method, involving  
measurement of the length and calculation of the reduction of  
depth of a crescent-shaped residual mark into the metal surface.  
The method of investigation and the special instruments used  
are described.

155 Makovskii, A.I. Investigation of Lubricant Circulation in a  
Model of the Oil Bath of a Vertical-pivot Thrust Bearing Used  
in Large Hydraulic Turbines

Lubricant circulation in the bath and between shoes of a thrust  
bearing (without cooling) was investigated by a thermo-  
electric method. A testing machine, built for this purpose  
at the Hydrodynamic Friction Laboratory, Institute of Machine-  
building, AN SSSR (Institute of Machine Science, Academy of  
Sciences, USSR), is used. The results of the investigation  
are described.

TITLE: On the Peculiarities of Resonant Vibrations in Two Mechanical Systems

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh nauk, Mekhanika i mashinostroyeniye, 1959, Nr 6, pp 137-140 (USSR)

ABSTRACT: The paper develops further the analysis of Kononenko, V.O. (Refs 1, 2). The vibrating system consists of a mass (base plate) mounted on elastic supports (with equal vertical and horizontal stiffnesses). The mass includes a motor (mounted on the baseplate) with a rotor having a certain moment of inertia and an unbalance provided by a certain mass at a certain eccentricity. The motor torque is given by its static characteristic curve (torque against speed). Damping is taken into account in all three degrees of freedom, namely the vertical and horizontal displacements of the motor and the rotation of the unbalance mass. The three equations of motion are set up and solved by the averaging method using the assumptions that the oscillations are near harmonic and that the angular velocity of the unbalance mass varies

slowly compared with the vibration period. These assumptions permit substitutions by which the equations of motion are reduced to a standard form wherein the variable coefficients are replaced by constants using the integral mean values during one period and so obtaining equations for the first approximation from which the amplitude and frequency in the vicinity of resonance can be obtained. Another system, in which torsional vibrations are excited by the inertia forces of unbalanced rotating masses, is illustrated. The system, embodied in a fatigue test rig for crankshafts, consists of a shaft with an inertia disc at one end. The other end carries two arms with journals at their extremities about which unbalanced masses rotate, being driven by intermediate planetary gears meshing with a sun-gear on the shaft. The whole unit is rotated by a motor. The angular coordinates on the inertia disc and the arm and of the planetary unbalance masses are the three degrees of freedom. A similar method of analysis is applied to the equation of motion as above. In both cases, the frequency equation can have one or three real roots. Some of these may have unstable solutions.

On the Peculiarities of Resonant Vibrations in Two Mechanical Systems

An analysis of stability shows that the descending branches of the resonance curves are unstable and the resonance curves plotted for stable solutions are different for increasing and decreasing frequencies. Experiments were carried out with mechanical models of the two systems as analysed. The experimental results are given in the form of resonance curves showing good agreement between measurement and analysis and the existence of unstable regions where the curves are interrupted.

TITLE: On the phase trajectories of an oscillator in the vicinity of the stability range boundaries

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye tekhnicheskikh nauk. Mekhanika i mashinostroyeniye, no.1, 1963, 194-196

TEXT: Certain vibration problems are described by a system of equations with two variables in which one term contains a product of the second derivative of one variable and a sine function of the other, thereby making a variable coefficient. This system describes the resonant properties of a centrifugal vibrator, the resonant processes in an oscillating system containing a motor and other mechanical systems (e.g. V.O. Kononenko, Izv. AN SSSR, OTN, Mekhanika i mashinostroyeniye, no.2, 1959; and S.S. Korablev, ibid. no.6, 1959). The behavior of the trajectories of the system in the vicinity of steady-state solutions belonging to the resonant region is examined in the present paper. In doing so, the "most dangerous" boundary of the stability region is

Card 1/2

On the phase trajectories of ...

S/179/63/000/001/030/031

established. This analysis yields a better basis than the purely geometric criterion obtained by Kononenko (op.cit.). Using asymptotic methods in the theory of nonlinear oscillations, a substitution is made containing three "slowly" varying variables. The original system is reduced to a standard form, and some small terms are neglected. Steady-state solutions can be obtained for the system of three equations so derived. The stability of the solutions is examined by the Routh-Horowitz criteria. The results of the analytical study were verified by means of an electronic analog computer. There are 4 figures.

1231. Bond strength of tread and breaker rubber stocks under repeated deformation. I. A. LEVITSKY, YU G. KONANLEY, A. E. KORNEV, and B. L. BABITSKIY, "Proektirovaniye" . . . , 1954, p. 173-83. (Vses. Khim. Otkrytiya, No. D.I. Mendeleeva, Dec., 1954). Multiply cylindrical test pieces with a diagonal joint, forming a tread-breaker-tread system, are tested on the MMS-1 machine, which subjects the test piece to cyclic compression at high velocity with a constant initial load being applied also. The bond strength increases on treating the rubbers with the bonding agent, increasing the thickness of the breaker strip of natural rubber, and increasing the period of vulcanization and the content (within certain limits) of sulphur and accelerators. The bond strength decreases when the period of plastication and the time of heating at 100°C are increased. The tread rubber referred to is 8JKB-30A, the breaker rubber natural rubber or 8KB. 1/5

TITLE: The strengthening of rubber films by alkaline lignin

SOURCE: Kauchuk i rezina, no. 2, 1964, 9-11

TOPIC TAGS: synthetic rubber, emulsion polymerization, zinc oxide, thiuram, sodium oleate, Leukanol, lignin, physicochemical property, vulcanization, calcium chloride

ABSTRACT: Commercial synthetic rubbers, and experimental butadiene-containing rubbers prepared at the polymerization laboratory of the Institut organicheskoy khimii AN SSSR (Institute of Organic Chemistry AN SSSR) were investigated. The lignin was obtained from waste sulfite liquor of wood pulp processing. Most of the mixtures consisted of 100 parts rubber (by weight), 5 parts of a 33% dispersion of zinc oxide, and 3 parts of a similar dispersion of thiuram. The solid ingredients were dispersed in a 5% aqueous solution of Leukanol in a ball mill. A 15% lignin solution in 20% ammonia was prepared, and up to 10% of it was added to the rubber dispersion. No vulcanizing agents were used for films prepared from SKD-1 and L-7 commercial rubbers, since the undercoat of calcium chloride (applied to the glass

TITLE: The utilization of standard cis-butadiene rubber SKD in protector rubber compounds

SOURCE: Kauchuk i rezina, <sup>23-</sup>no. 5, 1964, 4-7

TOPIC TAGS: protector rubber compound, cis butadiene rubber SKD, butadiene methylstyrene rubber SKMS 30ARKM15, plasticizer PN.6, carbon black KhAF, carbon black PM70, carbon black AySAF, protector compound technological property

ABSTRACT: Data are reported on the properties of protector rubber compounds obtained by combining cis-butadiene rubber SKD with butadiene-methylstyrene rubber SKMS-30 ARKM-15. The issuing material consisted of a typical protector compound on a SKMS-30 ARKM-15 base, filled with 50 parts (by weight) of carbon black of the KhAF type, various amounts of which were replaced by SKD. It was found that the compound containing 50 parts of SKD (vulcanized at 151C) showed high hardness, plasticity, and scorching tendency, but had a low resistance to cracking. All of its properties related to wear resistance showed a substantial improvement. Other tests were conducted on the effect of adding various

TITLE: Use of polyethylene in rubber mixes

SOURCE: Kauchuk i rezina, no. 2, 1965, 10-12

TOPIC TAGS: butadiene-styrene rubber, tread rubber, low pressure polyethylene, high pressure polyethylene, improved rubber mix, improved vulcanizate

ABSTRACT: A study has been made of the effect of polyethylene on the processability and physicomachanical properties of butadiene-styrene tread rubbers (SKS-30 ARKM-15). The experiments were conducted with KhAF carbon black-filled butadiene-styrene rubber mixes and vulcanizates containing 0-15% low- or high-pressure polyethylene (LPPE or HPPE). It was shown that the properties of butadiene-styrene rubber can be improved by the addition of LPPE, while HPPE hardly affects these properties. The different effects of LPPE and HPPE were attributed to a difference in structure. The results of the study indicated that the optimum amount of LPPE to be added to SKS-30 ARKM-15 tread mixes is 5%. Such mixes exhibit improved processability and reduced scorching and shrinkage. Their vulcanizates exhibit improved modulus at 300% elongation, and improved resistance to wear and ozone. Orig. art. has: 3 figures and 1 table. [BO]

TITLE: Phenol-containing rubber SKDF-10

SOURCE: Kauchuk i rezina, no. 11, 1965, 2-3

TOPIC TAGS: synthetic rubber, phenol containing rubber, copolymer

ABSTRACT: Phenol-containing rubbers have been prepared by emulsion copolymerization at 60C of butadiene and dimethyl(vinylethynyl)(4-hydroxyphenyl)methane(I) in the presence of diazoaminobenzene and hydroquinone. The best chemical, physical and mechanical properties were exhibited by copolymers containing 10% of I(SKDF-10 rubber). IR absorption spectra indicated that copolymerization occurs via the double band of I. SKDF-10 rubbers can be vulcanized by such agents as sulfur, phenol-formaldehyde resins, or hexamethylene tetramine. The formulation of the mixtures, the properties of the rubbers, vulcanization methods, and the vulcanizate properties are described in the source. The properties of SKDF-10 vulcanizates are similar to those of butadiene-styrene SKS-30 vulcanizates, but their fatigue strength in compression is
